Modern Landscaping, this is the approach Beeworks is taking to improve the landscape for pollinators. Landscaping needs to be more than just the planting and care of plants on a property. Landscaping needs to be modernized to include the needs of pollinators and insects, wildlife, regenerative properties for the landscape, elimination of chemical use in the environment, enhancing biodiversity, and an earnest approach to soil health.

Landscaping greatly enhances a properties value, not only financially, but also aesthetically. Now, with Pollinator Land Management, you can add pollinators health and well being to the already established benefits of landscaping.

Organic Pollinator Land Management

Your property can be improved for the local pollinators and honey bees with Pollinator Land Management! PLM aims to put more flowers and forage on the landscape for more of the growing year to help and encourage our pollinators.

The vast majority of landscapes do not have adequate forage or habitat for our pollinators. That is easily changed with Pollinator Land Management!

PLM Landscape Areas

*Yards/ Lawns
*Meadows
*Micro-Meadows
*Residential & Commercial Landscapes
*Field and Agricultural Borders
*Riparian Buffers
*Road Side Plantings
*Public Spaces
*Community Gardens

Specializing in Pollinator Lawns, Micro Meadows, and Meadows

Modernizing the American lawn

All organic pollinator land management. Lawns, micro-meadows, and meadows are a great opportunity to give our pollinators the forage and habitat that they need to thrive. Contact us if you might be interested in turning your lawn or landscape into a pollinator landscape!
Our Services

Modernizing Beekeeping by Replicating Natural Systems

At Beeworks, we install and maintain honeybee hives and apiaries on our clients’ properties.

All of our custom, handmade beehives are built from local white pine trees that are cut locally and milled to dimension by Arborworks Inc. and air dried in a our greenhouse. Our beehives are then hand built in the Beeworks wood shop.

We take tremendous pride in our beehives, and place an emphasis on top quality design and construction, and we build our hives in such a way as to optimize the health of the honeybees.

Pending favorable weather conditions, Beeworks will harvest any honey and/or beeswax in excess of what the bees need to survive and provide such to our clients for their consumption and use!

Honey Bees

Bees pollinate approximately 30% of the world’s food crops and 90% of wild plants.

Bees pollinate over $15 billion worth of crops in the United States annually.

Since 2006, approximately one-third of all honeybee colonies have collapsed due to various reasons, such as exposure to pesticides, loss of habitat, poor food supply, and parasite infestation.

They are scientifically known as Apis mellifera, meaning "honey-carrying bee."

Honeybees communicate via scent and dancing.

Honey can alleviate the effects of seasonal allergies, boost memory, aid in sleep, treat wounds and burns, and is an all-natural form of energy.

About Us

Beeworks LLC is a small family-owned company located in East Hartland, Connecticut.

Our founder, Dan Watkins, has spent his whole life gardening, landscaping, and working in nature. After learning of the struggling honeybee population and the many benefits honeybees have on vegetable, fruit, and vegetation productivity, Dan discovered the importance of helping the honeybee population for the benefit of his gardens and the ecosystem as a whole.

After just the first season of having honeybees on his property, Dan realized the positive effects they had on the production of his vegetable garden, fruit trees, and flower gardens.

Dan founded Beeworks in order to spread the word of the benefits of keeping honeybees, strengthen the honeybee population, and assist others in enhancing the productivity of their landscapes.
